Daily Deaths Curves & Rate of Onset/next Wave "Inclinometers"

5 day MA Trendline from date of 1st death (all on Log Scale)

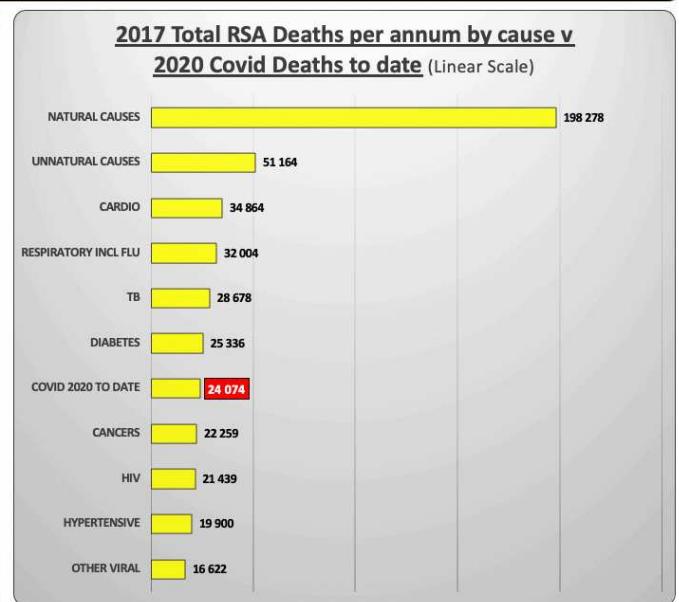

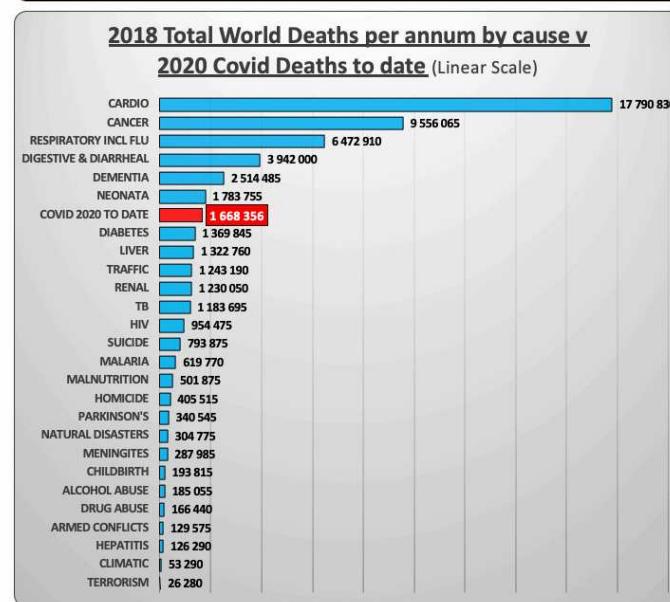

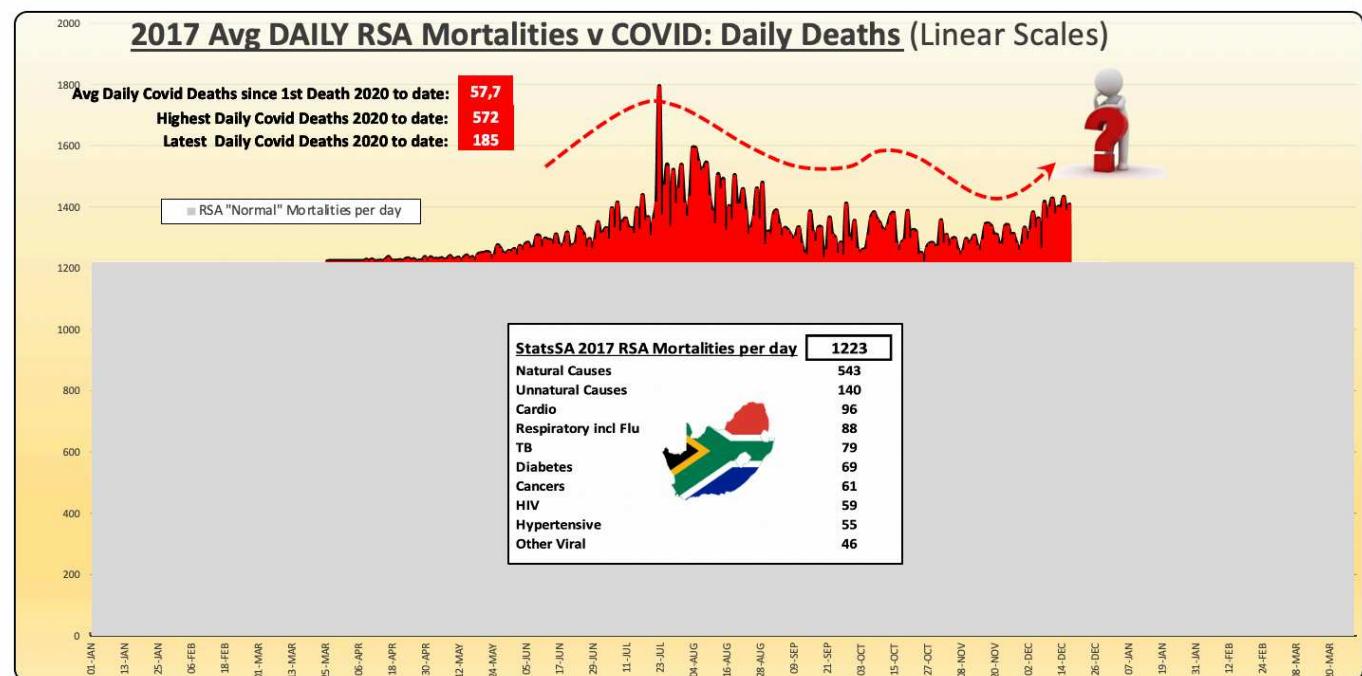

- Peaked but spiking again
- Passed peak but could rebound OR next wave
- Well past peak, unlikely to rebound
- Onset/1st wave
- 2nd & 3rd waves

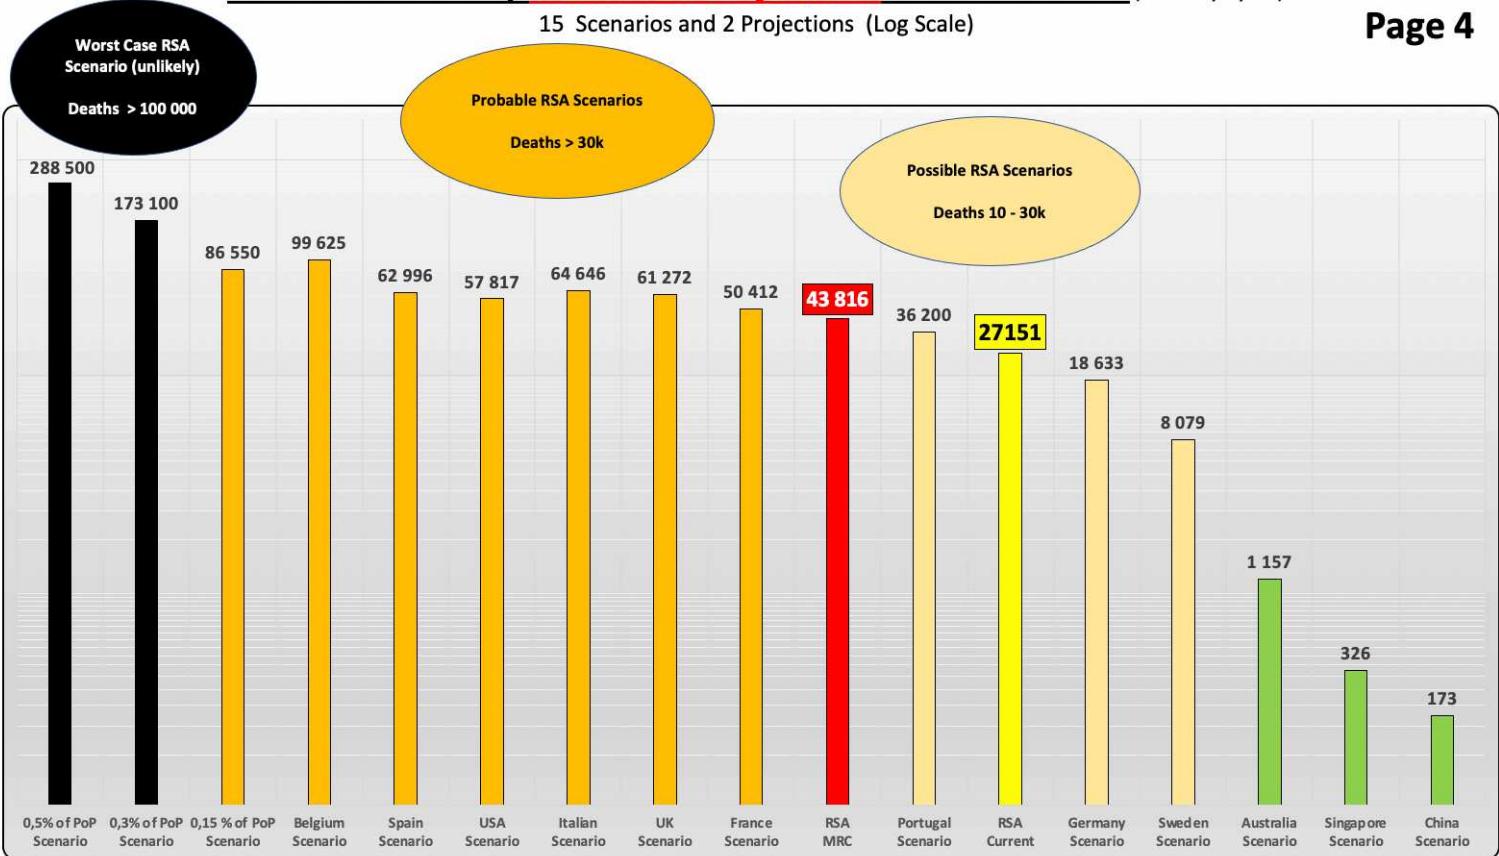

The two graphs WORLD (above) and RSA (below) attempt to put the number of Covid Deaths into some sort of perspective graphically.
The big GREY blocks are TOTAL Daily Avg Deaths from ALL causes over a full calendar year.
The RED area/lines on top of the Grey blocks are the INCREMENTAL Actual Daily Deaths due to Covid.
Obviously some of the Covid Deaths will "overlap" with the "normal" Deaths due to comorbidities.

RSA Covid Mortality Scenarios & Projections for end Dec 2020 (300 day cycle)

15 Scenarios and 2 Projections (Log Scale)

Page 4

Key:

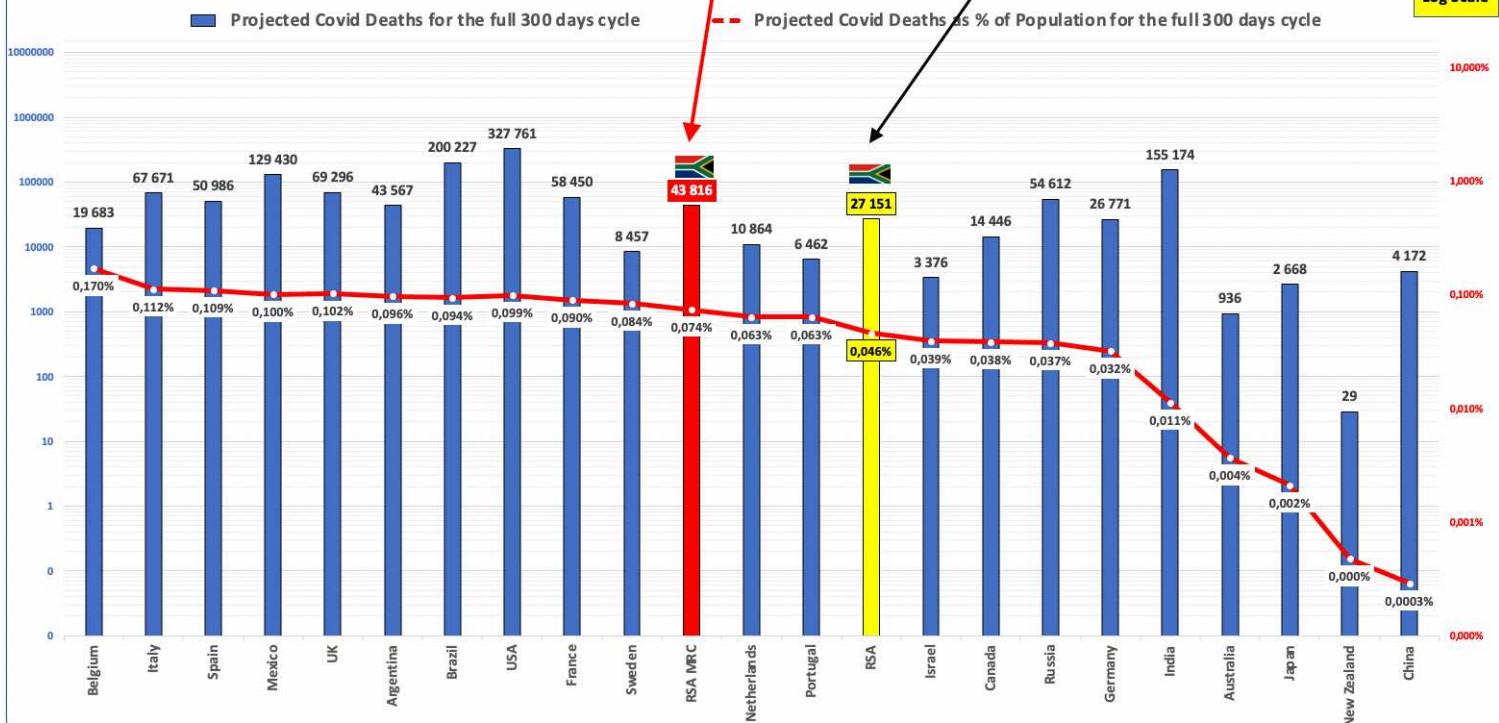

All Scenarios duly adjusted for population size and for the different timelines into the deemed 300 day pandemic cycle.

This projection uses the SA Medical Research Council data on "Excess Deaths". The assumption is that 90% of their reported Excess Deaths are probably due to Covid. The ratios are updated bi-weekly by the MRC but I apply these ratios to the official stats on a daily basis for this projection.

This number is simply the avg daily Deaths as reported to date x 300 (deemed cycle).

Projected Deaths by end Dec 2020 per country and % Deaths per Country Populations at current officially reported Death Numbers as reported by WHO (no "Excess" deaths)

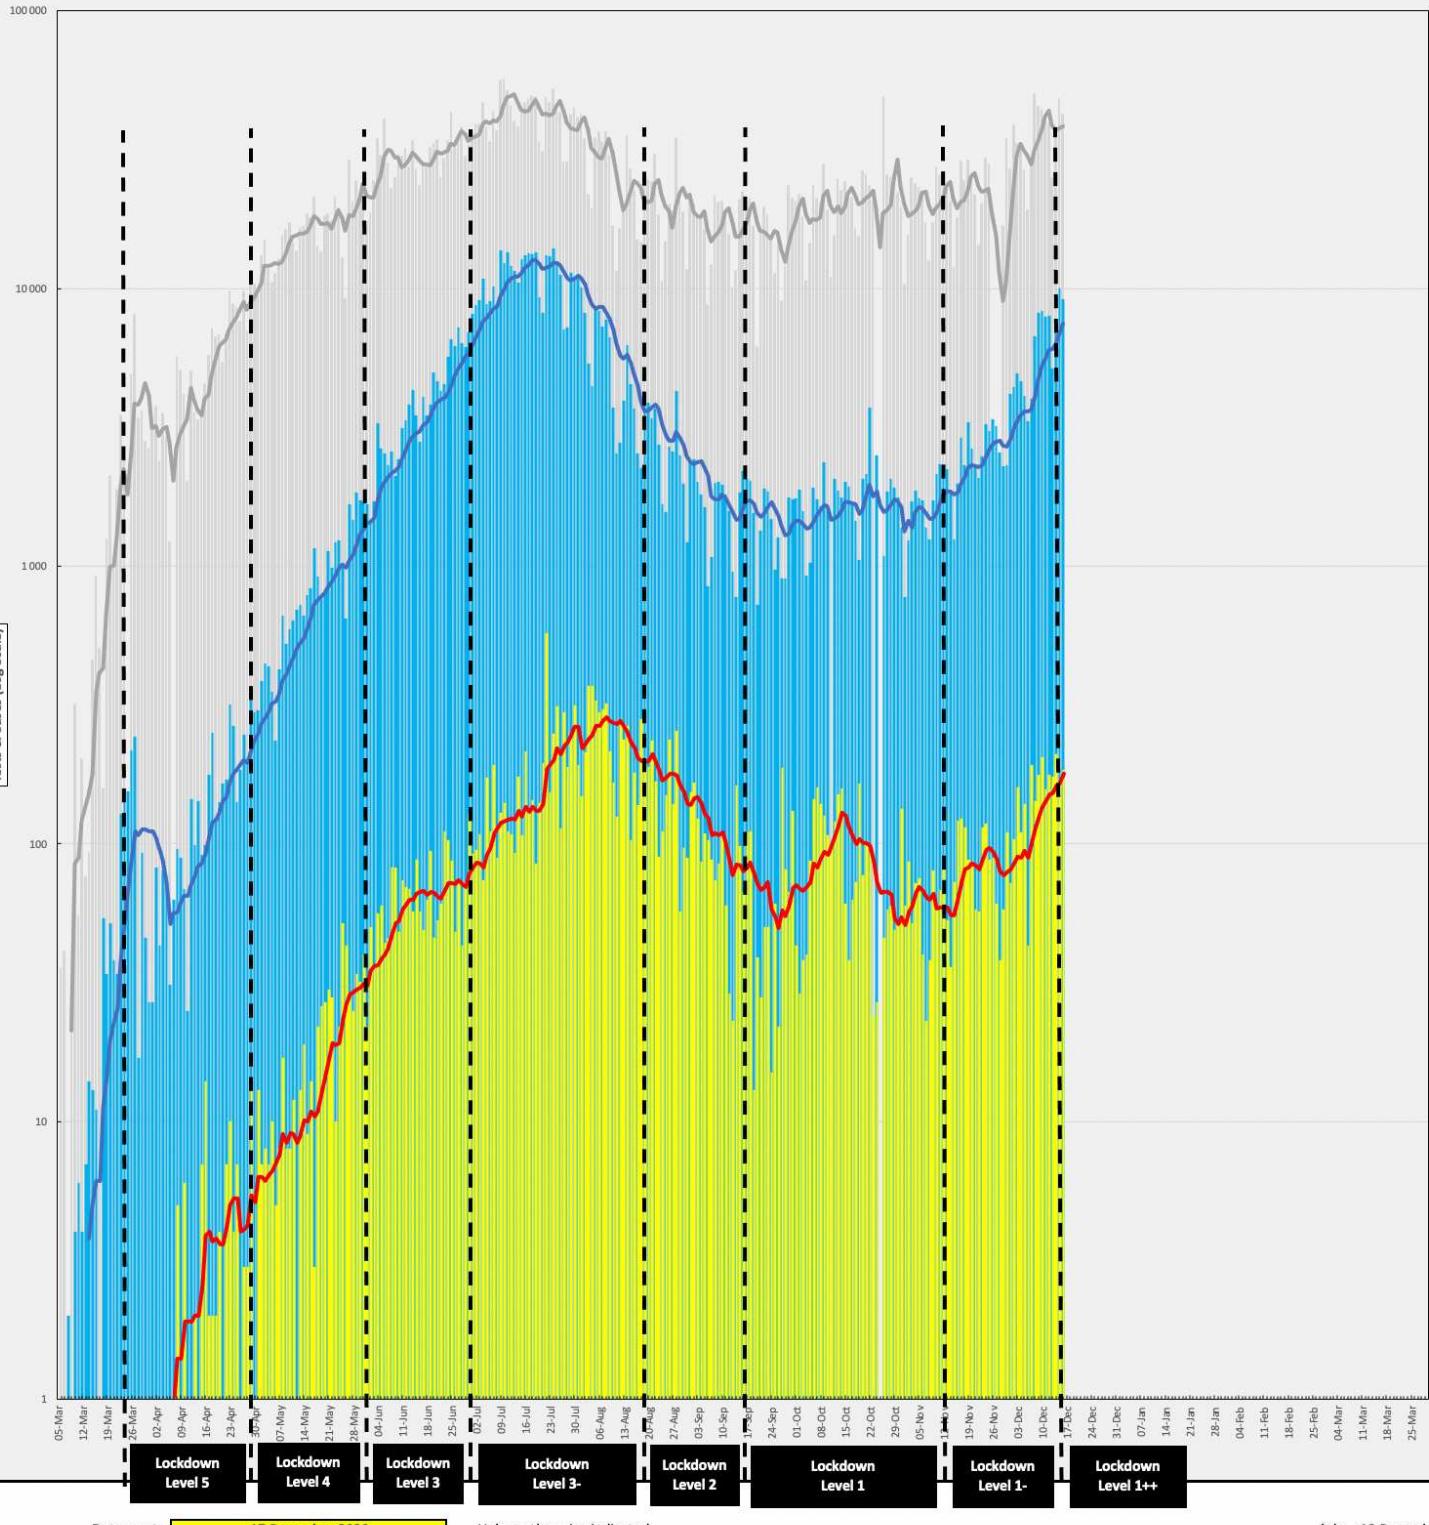

Log Scale

Note: Above Mortality %'s are overall projected mortality of the populations (PMR), NOT deaths of only those infected (CFR).

RSA: Age Categories of Covid Cases & Deaths

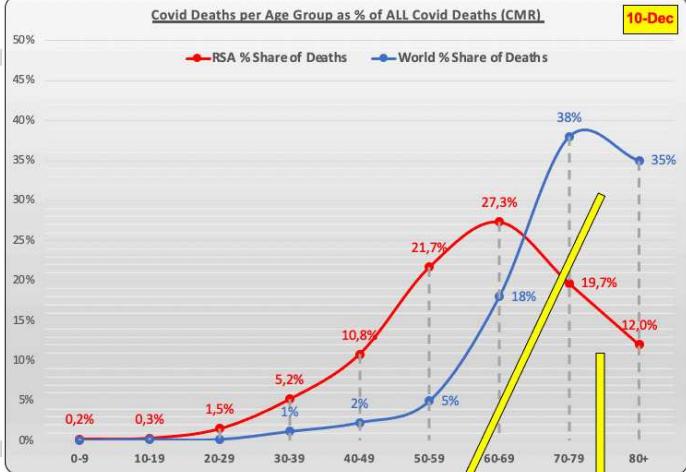

10-Dec

Probability of DYING based on % Deaths of Cases in each Age Group (Age Group CFR)

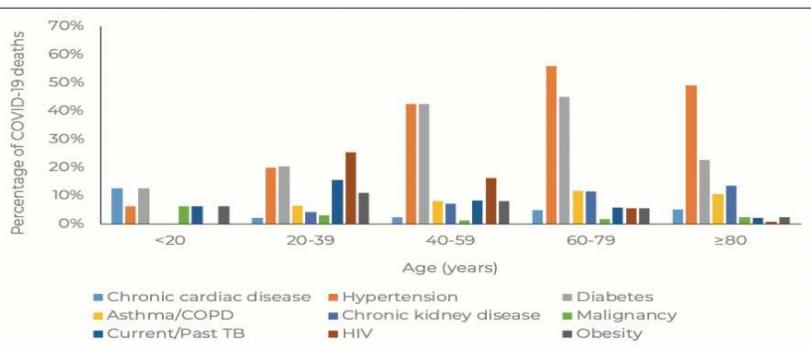

10-Dec

Covid Deaths per Age Group as % of ALL Covid Deaths (CMR)

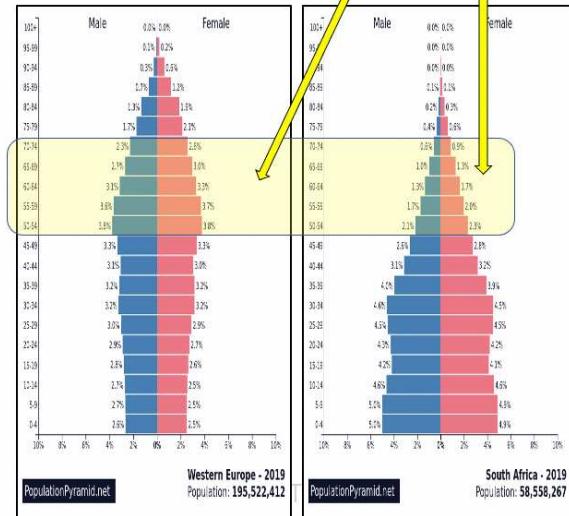

10-Dec

COVID-19 Fatality Rate by AGE:

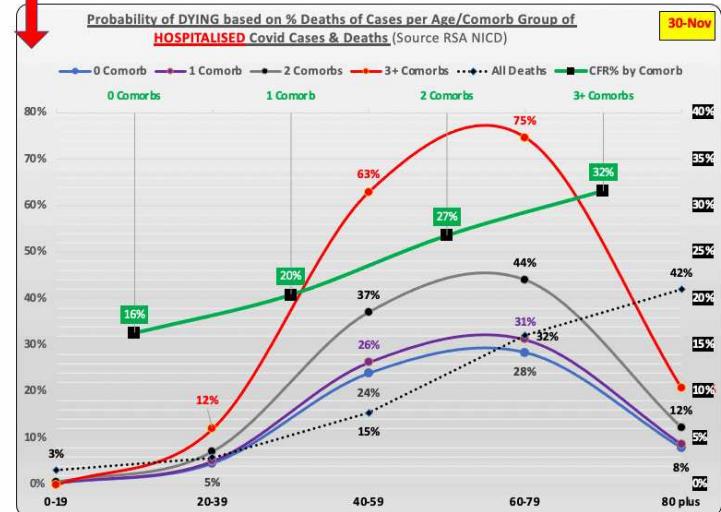

*Death Rate = (number of deaths / number of cases) = probability of dying if infected by the virus (%). This probability differs depending on the age group. The percentages shown below do not have to add up to 100%, as they do NOT represent share of deaths by age group. Rather, it represents, for a person in a given age group, the risk of dying if infected with COVID-19.

Western Europe - 2019
Population: 195,522,412

South Africa - 2019
Population: 58,558,267

Probability of DYING based on % Deaths of Cases per Age/Comorb Group of HOSPITALISED Covid Cases & Deaths (Source RSA NICD)

10-Dec

CFR & CMR %'s per Age & Gender of HOSPITALISED Covid Cases & Deaths

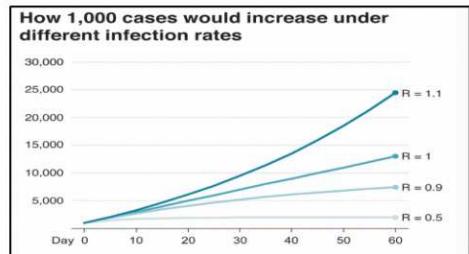

10-Dec

The Reproduction Number, R, derived from Currently Infectious estimates, see below

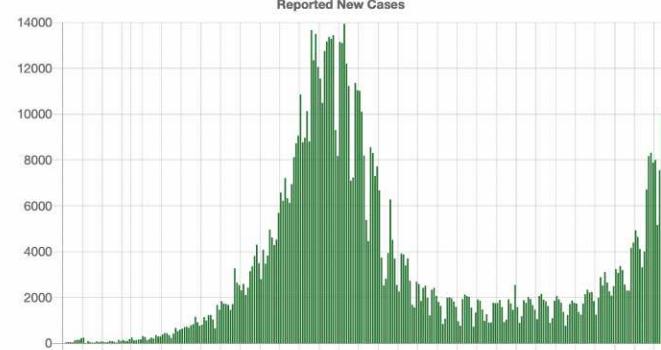

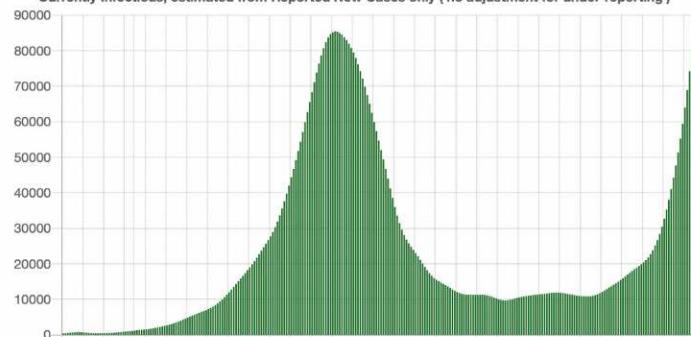

A Rt below 1 suggests that the number of cases is shrinking, possibly allowing societies to open back up.. A Rt above 1 indicates that the number of cases is growing, perhaps necessitating renewed lockdowns or other measures.

Movement from previous day

Currently Infectious, estimated from Reported New Cases only (no adjustment for under-reporting)

RSA Covid Stats: National & Provincial Analysis

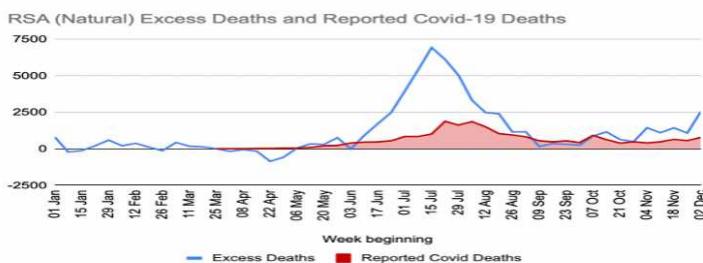

Page 6

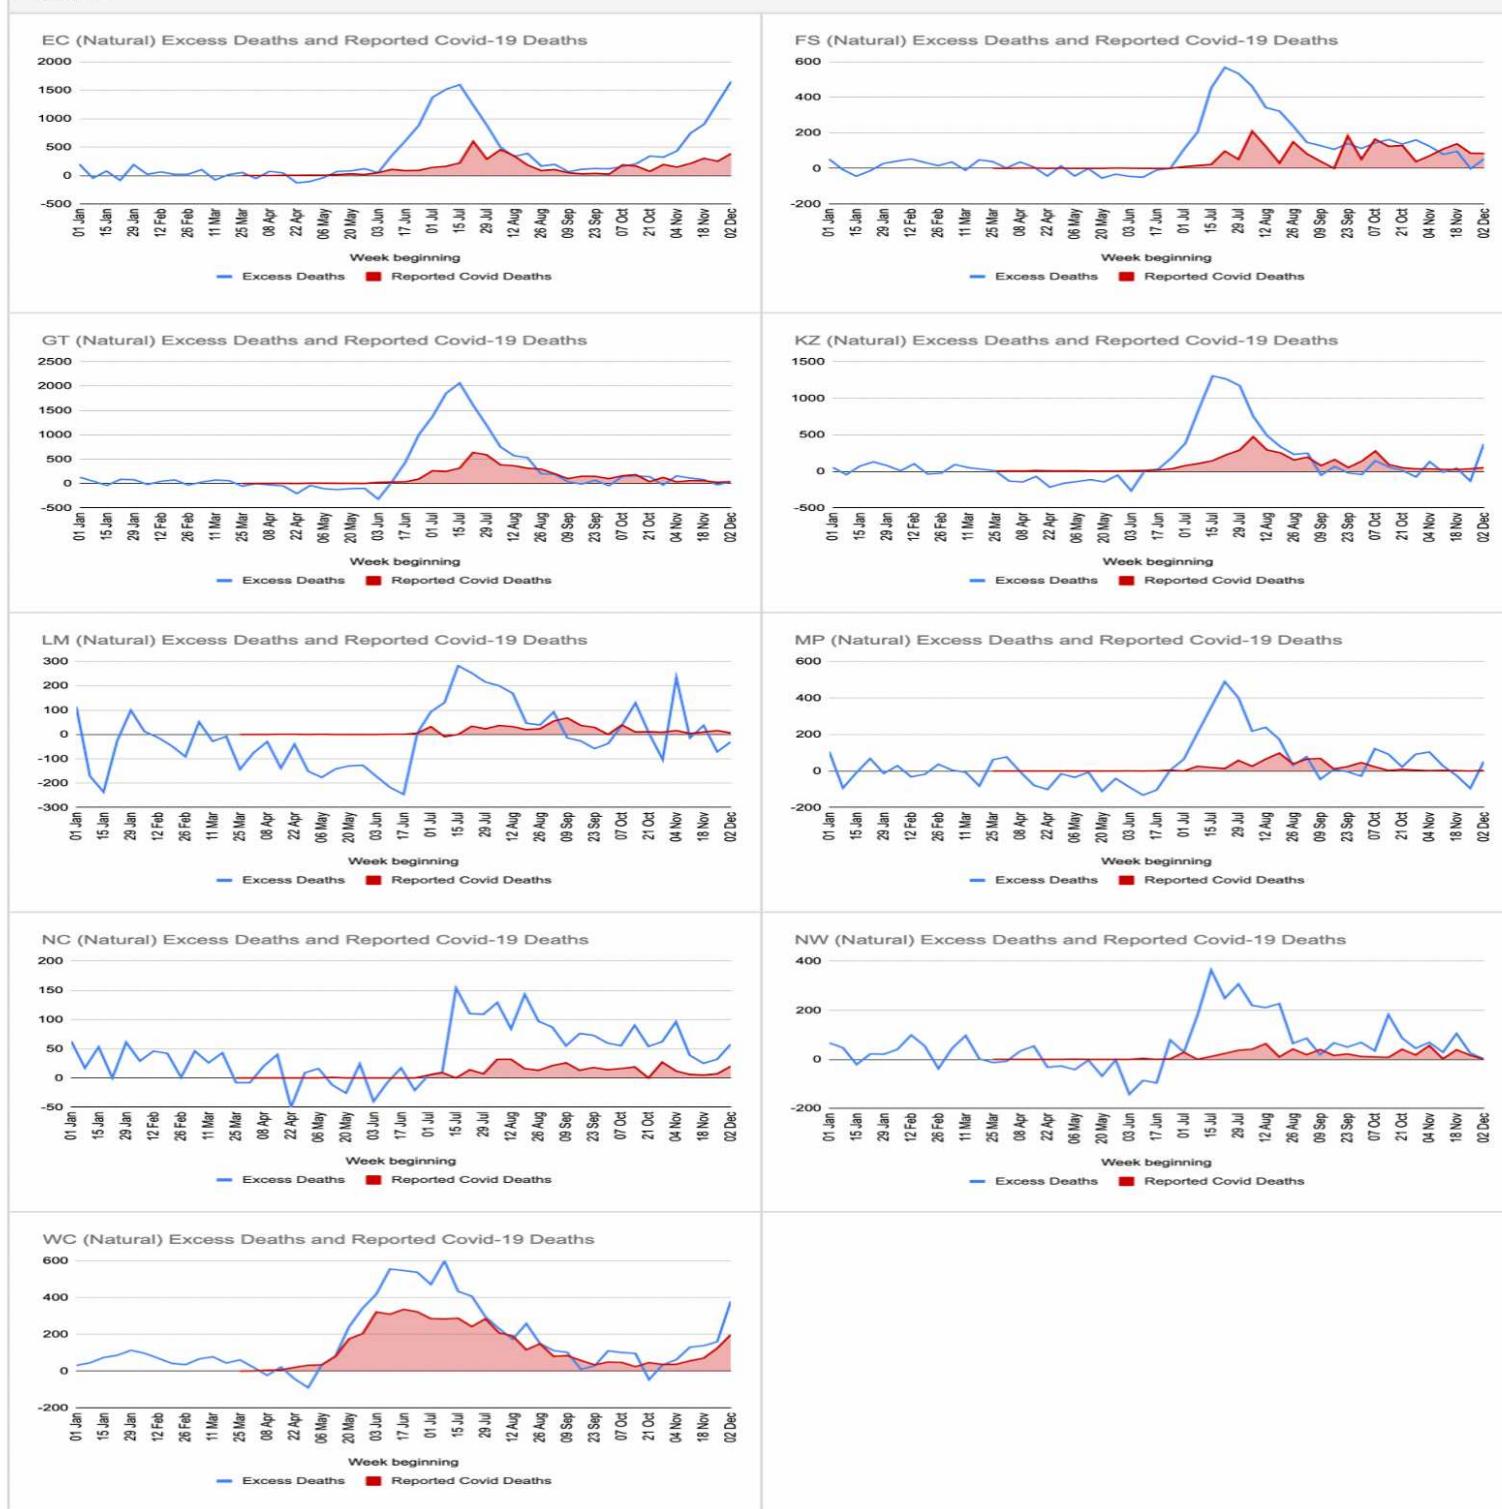

RSA Excess Deaths as per SA Medical Research Council

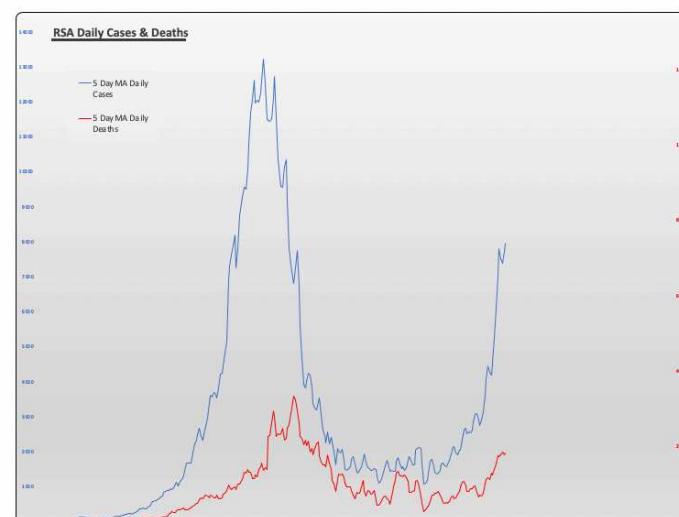

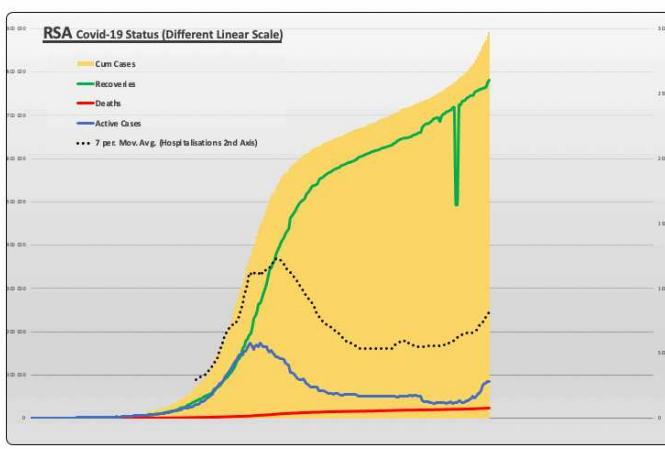

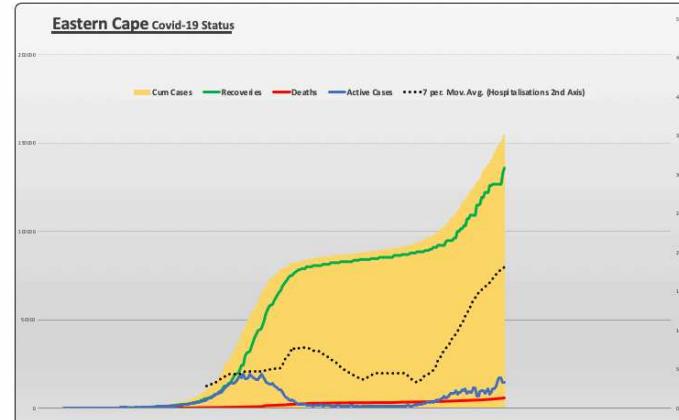

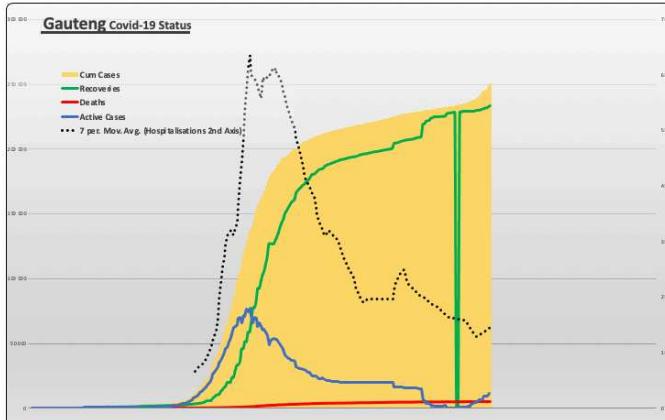

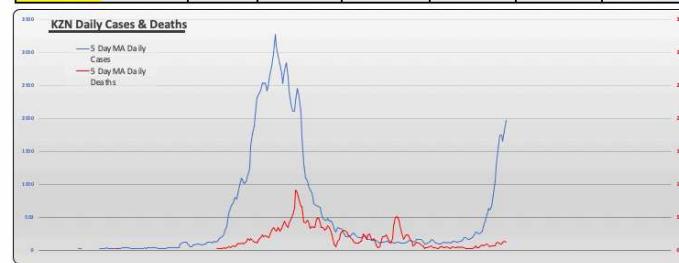

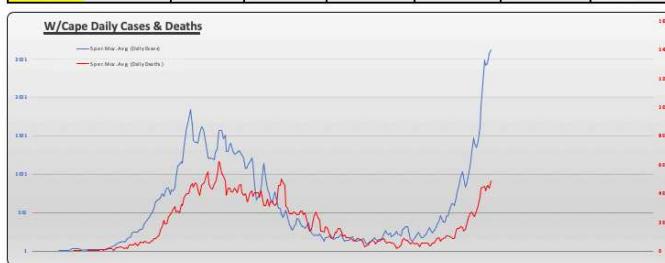

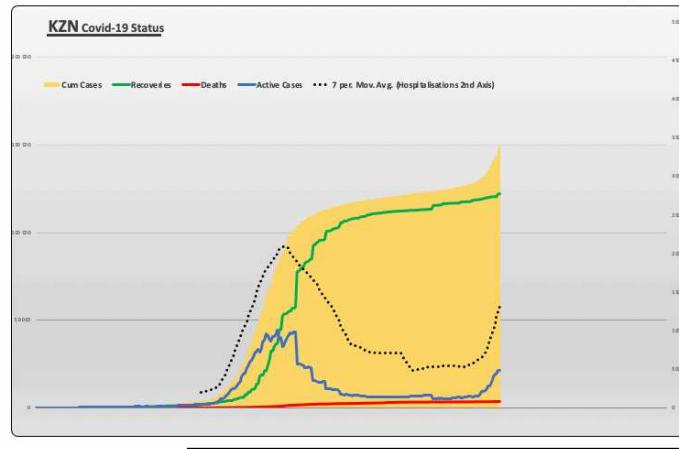

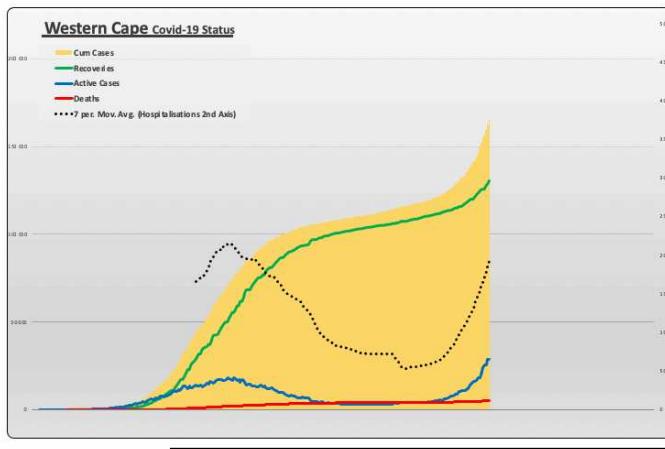

Page 6.1

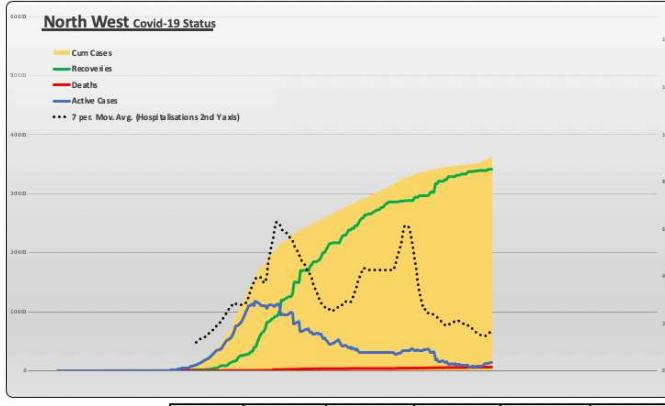

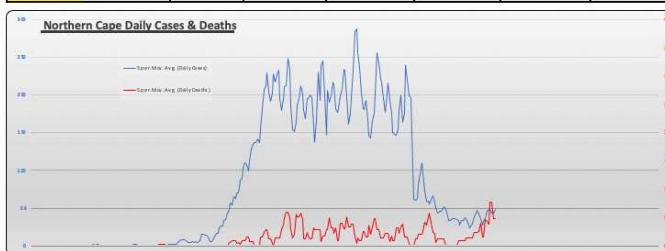

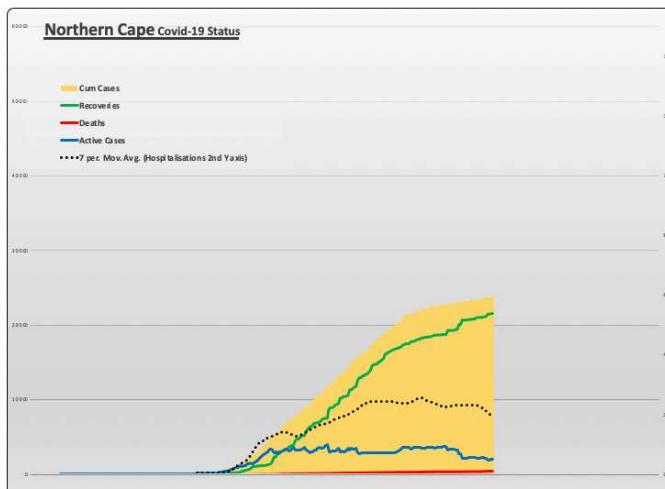

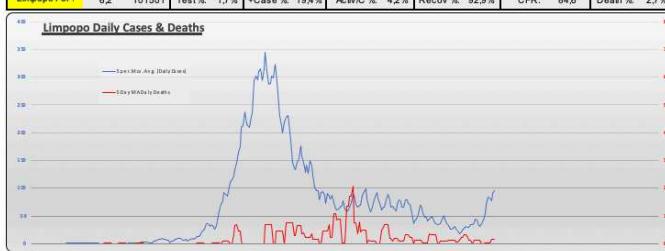

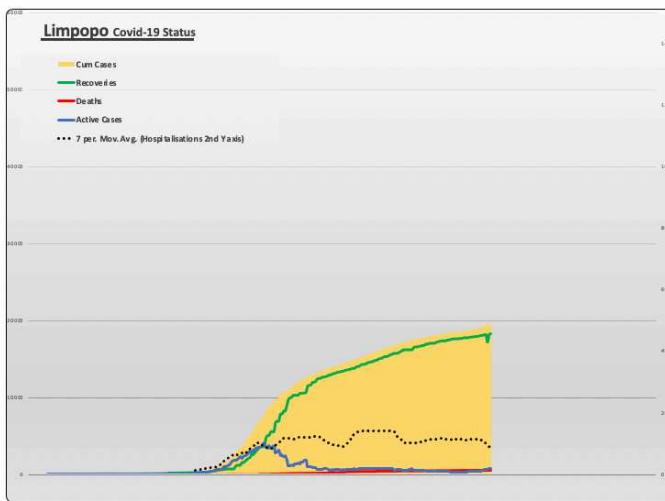

One approach to aid understanding of the emerging COVID-19 mortality is to compare the estimated weekly excess deaths with the number of COVID-19 deaths reported by the Minister of Health as shown in the figure below. This comparison is hampered to some degree by the fact that the excess deaths are classified by week in which the death occurred; the reported COVID-19 deaths are classified by date the numbers are reported to the Department. If all excess natural deaths were due to COVID-19, and all COVID-19 deaths were perfectly identified and reported, the two series would be identical. The number of estimated excess deaths has begun to decrease, consistent with the trend in the number of confirmed COVID-19 deaths. Although more data are needed on the underlying causes of death, this observation is strongly supportive that a significant proportion of the current excess mortality being observed in South Africa is likely to be attributable to COVID-19.
